## Question 1

A GUI (Graphical User Interface) allows users to interact with a computer using \_\_\_\_\_, \_\_\_\_\_, and \_\_\_\_\_ rather than typed commands. Users point and click with a \_\_\_\_\_ to open files and launch programs. Windows, macOS, and most mobile OSes use a GUI by default.

*Answer: Icons, windows, menus; mouse (pointer).*

## Question 2

A CLI (Command Line Interface) requires users to type \_\_\_\_\_ as text. The CLI on Windows is \_\_\_\_\_ (cmd.exe) or \_\_\_\_\_. On Linux and macOS it is the \_\_\_\_\_. The CLI is preferred by administrators for \_\_\_\_\_, as commands can be scripted and repeated across many systems.

*Answer: Commands; Command Prompt; PowerShell; terminal (bash/shell); automation.*

## Question 3

A NUI (Natural User Interface) uses \_\_\_\_\_, \_\_\_\_\_, or \_\_\_\_\_ as input rather than a mouse or keyboard. Voice assistants like \_\_\_\_\_ and \_\_\_\_\_ are examples of voice-based NUIs. Gesture-based NUIs are used in gaming (Microsoft \_\_\_\_\_) and surgical robotics.

*Answer: Touch, voice, gestures; Siri, Alexa (or Google Assistant); Kinect.*

## Question 4

A touchscreen interface accepts input directly from \_\_\_\_\_ or a \_\_\_\_\_ on the screen surface. Capacitive touchscreens detect the electrical conductivity of a human \_\_\_\_\_ and are used in smartphones. Resistive touchscreens respond to \_\_\_\_\_ and can be used with a stylus or gloved hand.

*Answer: Fingers; stylus; finger; pressure.*

## Question 5

A menu-driven interface presents users with a list of \_\_\_\_\_ to choose from. This is more accessible to \_\_\_\_\_ users but less flexible than a CLI. Examples include ATM screens, kiosk check-in systems, and \_\_\_\_\_ (basic menus found in the router or BIOS configuration screen).

*Answer: Options (choices); non-technical; BIOS/UEFI setup.*

## Question 6

Accessibility features in operating systems are \_\_\_\_\_ adaptations that make computers usable for people with disabilities. Examples include \_\_\_\_\_ (reads screen content aloud for visually impaired users), \_\_\_\_\_ (enlarges text and interface elements), and \_\_\_\_\_ (allows keyboard control via an on-screen keyboard for users who cannot use a physical keyboard).

*Answer: Interface; screen reader (narrator); magnifier; on-screen keyboard (sticky keys / filter keys).*

### Question 7

UI vs UX: \_\_\_\_\_ (User Interface) refers to the visual elements a user interacts with -- buttons, icons, layout, colors. \_\_\_\_\_ (User Experience) refers to the overall feeling and ease a user has while completing a task. A UI can look visually appealing but have poor \_\_\_\_\_ if it is confusing or inefficient to use.

*Answer: UI; UX; UX.*

### Question 8 -- Real World Application

REAL WORLD: A government agency is deploying a self-service kiosk for citizens to register for public services. The kiosk will be used by elderly citizens, people with low digital literacy, and individuals who are visually impaired. Describe three specific interface design features you would include to make the kiosk accessible and usable for all these groups.

*Answer: Feature 1 -- Large text and high contrast: use minimum 18pt font and high contrast colors (e.g., black text on white background) for users with low vision or difficulty reading small text. Feature 2 -- Simplified menu-driven navigation: use large clearly labeled buttons with simple language (e.g., Register for Benefits) and a maximum of 3-4 choices per screen, avoiding jargon. This helps low-digital-literacy users complete tasks without needing technical knowledge. Feature 3 -- Screen reader / audio output: include a headphone jack and screen reader mode triggered by a physical button, so visually impaired users can hear each menu option read aloud. Also add tactile buttons or Braille labels for key actions. Feature 4 (bonus) -- Adjustable interface height or touch angle to accommodate wheelchair users.*
